ABSTRACT

The main idea of this project is used to connect the different events of different colleges. Through this, project one can post their events online and make the students register for these events. It reduces the lack of communication between colleges and students. It has a list of upcoming events and ongoing events of the respective college. It helps the students to register for events in an easy way. We are proposing a system which has events of different colleges in one place. It helps the admin to manage the college's data and events data effectively. It reduces the time and cost to the colleges.

INTRODUCTION

It mainly focuses on the event-based service to the colleges. Using this web application reduces direct communication. The admin can add the new event conducted in their college and can provide the respective brochure and registration link on the website. This helps the students to register for the event in an easy way.

It has a floating window that contains the upcoming events and ongoing events of different colleges, such that the student can view the events. It reduces the time to go and advertise the events and send the post to the colleges.

LITERATURE REVIEW

Every organization, whether big or small, has challenges to overcome and manage every event. It has different event needs. It is designed to assist in strategic planning and it will help to ensure that your organization is equipped with the right levels of information and details of your future goals. It ultimately allows you to better manage resources. It has different channels to communicate between events. It allows the user to select the events. It has been broken down into three elements. They are application models where the data resides.

Disadvantages:

- It doesn't have admin interfaces
- It doesn't have the data of different college events
- With this app, one can only select the events and they are not provided with any registration link and brochure of the respective events

EXISTING SYSTEM

In the existing system, students are unable to know the workshops, hackathons, and coding competitions in one place. It increases the difficulty for students to know the events occurring in different colleges. For marketing the events one has to send the post to the colleges hence it increases the lack of communication between students and

events. Nowadays it has been difficult to manage the events and assign the tasks to the volunteers.

Disadvantages

- It doesn't have admin interfaces.
- It doesn't have data on events of different colleges.
- in the existing system, one can only select the events and they are not provided with any registration link and brochure of the events.
- It does not contain a list of upcoming events and ongoing events.

PROPOSED SYSTEM

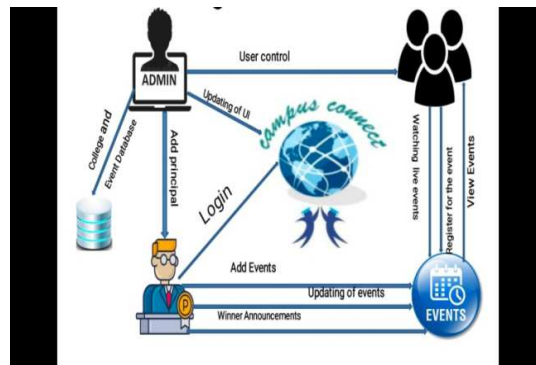

It connects the different events of various colleges. You can post the events online and make the students register for these events. We are building communication between colleges and students. It has a list of upcoming events and ongoing events such as hackathons, workshops, conferences, symposiums, and coding competitions of the respective college. It helps you to register for events in an easy way. It helps the admin to add the new events and to provide registration links for the event in an easy way.

Advantages

- It is very easy to maintain multiple events in one place.
- It has winner details and sample videos of events that were completed in past.
- It efficiently works in desktop mode and mobile also.

- The other participants can watch the event online by using the live section provided on our website.
- The admin can export the college's list and events list into an excel sheet.

SYSTEM ARCHITECTURE

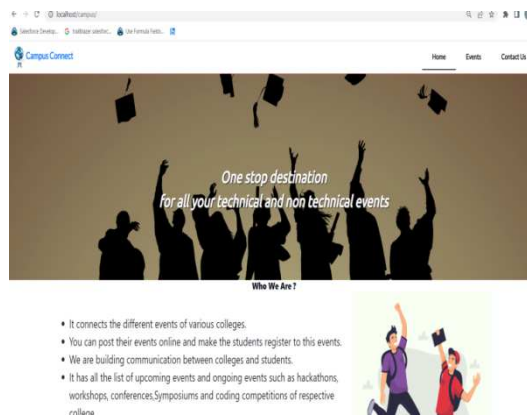

Description:

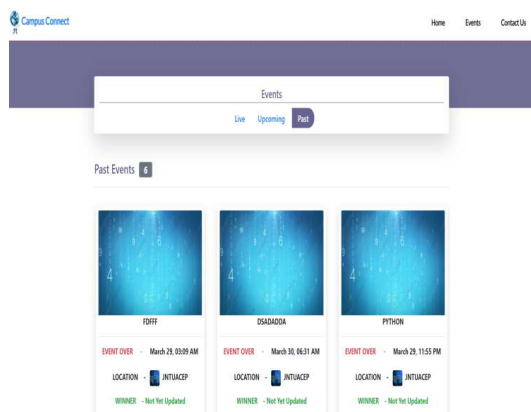

- **Admin module:**
 - Adding principals
 - Maintaining the college and events database
 - Generating the credentials for principals
- **Principal module:**
 - Adding and updating events
 - Announcing the winner of the events
 - Providing registration link to the user
- **User module:**
 - Register for the events
 - Participate in events
 - Watch live events
