#### ABSTRACT

The Philippines is a third-world country, there are a count of 19.99 million of individuals who are living in a poverty state, which represents 18.1 percent of the population which makes financial insurance fundamental. Philhealth claimed to be successful in their medical aid for indemnity, this review article will proffer the status of their services centrally focusing on the indigent sectors evaluating it's feasibility. As time pass by, different phenomena that are connected to health insurance issues emerge, and with the constant evolution of the medical world there is a continuous requirement for adaptability, with this matter in hand the Philippines constitution has come to a lot of emendation in order to develop the healthcare service of the country. In this way, it allows a wider breadth of universal healthcare services. Philippine healthcare insurance is an essential resource to possess for people living in the Philippines. As its purpose is to proffer universal healthcare aiming specifically on indemnity that focuses on a variety of individuals that are coming from different sectors of the community. This ought to be accessible and efficacious in terms of when and where people demand it. The medical services offered may come from different health assistance which are prevention, promotion of health, treatment, and rehabilitation.

**Objective:** It provides information that will pave the way for data in terms of the repleting status, lacking qualities, advantages, and disadvantages of Philippine health insurance, with a central focal point to the poor sectors of the country. Proffering informative well-grounded data that may benefit the betterment of the country's medical health insurance benefits, especially for indigent individuals.

Methods: This review article provides data from various reliable sources on the internet all related to the feasibility of medical insurance for the indigent community.

Results: Based on the data stated in the results and discussion of this review article, regardless of the benefits of medical insurance, another matter contributes to making them not securely covered with health insurance, especially to the people living in rural areas in the Philippines, geographic remoteness of the place making healthcare service difficult to achieve as this still needs their personal finances for the expenses which are not covered by the medical care indemnity. Another factor that affects the wide and deep coverage of medical insurance in the Philippines is the lack of revenues, making the community utilise out-of-pocket money, with that being matter it proffers financial problems to the indigent sectors. Some Filipino citizens in this socioeconomic area are not knowledgeable and do not understand enough about the big role medical insurance plays. This causes a holdback as this will not induce them to become part of a medical insurance program.

**Conclusion:** Despite the aim of providing universal health care to different sectors, the country's still lacking its services, especially for the indigent community. As there are other matters that contribute to covering financial problems in terms of medical care.

### INTRODUCTION

According to a study from the Family Income and Expenditure Survey, the PSA reported that 19.99 million people in the Philippines—or 18.1 percent of the population—live below the poverty line (Palatino, 2022). The constitution is being established with this issue in mind as an emanation for broadening and deepening financial support. One of their areas of attention is medical insurance, a need for the underprivileged. When President Rodrigo Duterte signed the Universal Health Care Bill into law in February 2019, the Philippine healthcare sector witnessed considerable changes (World Health Organisation, 2019). The purpose of this Review article is to conduct study on the viability, usefulness, and practicality of medical insurance for the underprivileged, such as PhilHealth. to observe what issues develop or what advantages come their way. Finding out what needs to be focused on as healthcare professionals and how we can aid the county through research on this subject is helpful. 74% of poor households said it was difficult to find the money for therapy (National Statistics Office, 2013). One of the most prominent features of the UHC Law is the expansion of population, service, and financial coverage through various health system changes. Along with this, a paradigm shift in favor of primary care, which is at the core and center of all health developments under the UHC, is predicted. In the Philippines, out-of-pocket medical costs increased by 150% from 2000 to 2012. (Family Income and Expenditure Surveys, 2012).

All Filipinos have equitable access to high-quality, cost-effective health care services and products, as well as safety from financial risk (World Bank., 2011). Review of the Philippine Health Sector. The World Bank. Thanks to the UHC, every Filipino is safeguarded from health risks and dangers and

has access to affordable, high-quality, and conveniently located health services that are suitable for their needs (Department of Health, 2019). However, economists disagree on the question of whether having health insurance increases the use of healthcare services by the underprivileged in developing countries (Wagstaff, A., 2010). Social health insurance has a beneficial and statistically significant impact on how frequently its poorer members use medical services, according to various empirical investigations (Galarraga et al., 2010). (Panpiemras et al., 2011). Social health insurance is one potential means of paying for medical treatments (Wagstaff, A., & Moreno-Serra, R., 2009). It aims to reduce health inequities by giving low-income households free access to medical care. According to economic theory, social health insurance decreases healthcare costs for those who cannot afford them, increasing the use of medical services (Trujillo et al., 2005). The uninsured tend to be more seriously ill when they are diagnosed, receive less preventative and diagnostic services, and receive worse therapeutic care, according to studies that support these findings (Hadley, J., 2003; Addington, W. W., 1999). (American College of Physicians-American Society of Internal Medicine., 2000).

#### **METHODS**

This research is a Review Article and will be conducted using researching past articles about this topic and comparing it on different results (McCombes, 2022). The first method that allowed us to compare poor PhilHealth participants to similar non-participants is to compare and contrast the situations of the participants from one another (Bautista, M. C., 2020). Case—health care contracts and social contract are all coming from PhilHealth's social health insurance. In Contractual Management (pp. 337-364). Springer Vieweg, Berlin, Heidelberg.. We will also compare the benefits of those indigents that availed the Philippine Universal Health Care from those indigents that didn't avail (Bredenkamp, et al., 2017), (Picazo, et al., 2015). This can make us see the benefits and the perceived benefits and the perceived barriers between the two types of situations (McKinney, R., & Shao, L. P., 2008). Another type of methodology results to represents the likelihood that the head of an impoverished household will be admitted to the program, was calculated by utilizing a model called probit and having these variety of variables that is self explanatory: the head's age, gender, level of education, household wealth, health status, size of the household, proximity to a health center, and lastly is the number of young individuals children to be specific, who had unfortunately died from a disease (Macapanpan, M. L., 2015). In reference to the current literature, the last four variables are introduced for the first time (El Omari, S., & Karasneh, M., 2021).

#### RESULTS AND DISCUSSIONS

Table 1.

| Author and Year                       | Title  | Method   | Result   |
|---------------------------------------|--|--|--|
| 1. Omari, S., & Karasneh, M., (2021). | Social health insurance in the Philippines: do the poor really benefit?  | Medical Health Insurance is a feasible avenue of paying for medical treatments by providing free medical services for those who have low income.   | It seeks to lessen barriers to treatment. Standard economic theory states that medical health insurance actually reduces the cost of medical fees for people who cannot afford it, hence improving the usage of medical services [21].   |
| 2. Bredenkamp, C. (2017)              | Awareness of Health<br>Insurance Benefits in the<br>Philippines  | The purpose of the current study was to examine the implications of recent changes to the Philippines' social health insurance system.   | The Philippines' health insurance coverage has steadily risen in recent years., particularly among the underprivileged [10].   |
| 3. Balamiento, N., (2018)             | The impact of social health insurance on healthcare utilisation outcomes: evidence from the indigent program of the Philippine National Health Insurance | Philhealth take the lead in implementing the nation's National Health Insurance Program, decentralisation, and the country's worsening socioeconomic status all contributed to the creation of the Phil-Health Indigent Program. | With the integration of universal health care, the Philippines is currently one of South East Asia's pioneering countries. The ultimate goal is to provide equitable access to healthcare services for everyone, regardless of their social background or financial situation.[8]. |
| 4. WHO, 2020                          | Community-based health insurance   | Community-based health insurance (CBHI) programs are typically voluntary and distinguished by the pooling of   | The classic Community - based<br>health insurnce approach,which<br>primarily relies on spontaneous,<br>small-scale initiatives that  |

|                          |  | funds by members of the community to help cover the expense of healthcare.  | provide minimal to no financial support for the underprivileged and disadvantaged groups, appears to have limited potential for assisting nations in their transition to universal health coverage, according to both theory and evidence. [68]                 |
|--------------------------|--|---|---|
| 5. Lim, B.(2019)         | Philippine National Health<br>Insurance Assistance<br>program  | Filipinos can eventually receive health treatments through the government's PhilHealth health insurance assistance program, regardless of their age, gender, or social standing. Every Filipino is automatically registered in the Universal Health Care law's government health assurance program. | As a result, individuals will be immediately eligible for health services like preventive care for their physical, mental, and perhaps even dental health [33].   |
| 6. Biggeri, M. (2018)    | Assessing the feasibility of community health insurance in Uganda: A mixed-methods exploratory analysis. | The current study aims to use a mixed-methods strategy to evaluate the viability of Health Insurance. In order to determine the viability of establishing the micro insurance, eight preconditions are specifically suggested.  | Community health insurance (CHI) is designed to safeguard finances and ease access to healthcare for underprivileged remote communities.[11].   |
| 7. Tingog, P. (2021)     | Medical Assistance for<br>Indigent Patients Program.<br>Party list.                                      | The Department of Health's (DOH) Medical Assistance for Impoverished Individuals Program (MAIP) was created to help indigent patients who needed medical attention while receiving treatment, receiving rehabilitation, getting an exam, or being admitted to a government hospital.                | All destitute patients in non-private or service settings at all government healthcare facilities accredited by PhilHealth are eligible for the No Balance Billing policy [58].   |
| 8. Montemayor, M. (2019) | Health for all Filipinos:<br>Universal Healthcare Law.<br>Republic of the Philippines<br>PNA             | The law dictates that upon automatic enrollment into the government's health insurance scheme, every Filipino, including overseas Filipino workers, is eligible for preventative, curative and rehabilitative, diagnostic, therapeutic, and palliative treatment.                                   | All Filipinos now have fair access to high-quality, reasonably priced healthcare services due to the implementation of Republic Act 11223, also known as the Universal Health Care Law [39].  |
| 9. Villar, M.( 2020)     | Free Medical for Indigent<br>Filipino Women  | Free medical for a person who has been identified by the Department of Social Welfare and Development (DSWD) based on specific criteria set for this purpose in accordance with the guiding principles set forth in Article I of this Act as having no apparent source of income or                 | 18.0 percent, or 4.74 million poor households, were expected to be living in poverty during the first quarter of 2021. In the first semester of 2021, the subsistence incidence among families was estimated to be 7.1%, or roughly 1.87 million families [63]. |

|  |   | having an income that is insufficient for the maintenance of his family.   |  |
|--|---|--|--|
| 10. David, M.,( 2005)  | Field based evidence of enhanced healthcare utilization among persons insured by micro health insurance units in the Philippines  | One of the primary objectives of<br>the health system should be to<br>ensure that everyone has<br>adequate access to healthcare and<br>this does not necessarily occur in<br>nations with lower incomes or<br>extremely unequal income<br>distribution.  | According to reports, healthcare utilization is very low in low-income and rural communities [16].   |
| 11. Querri, A., Ohkado, A., Kawatsu, L., Remonte, M. A., Medina, A. et al., (2018) | The challenges of the Philippines' social health insurance programme in the era of Universal Health Coverage  | A comprehensive investigation combining quantitative and qualitative techniques. Semistructured interviews with employees of pertinent organizations were undertaken in addition to the collection of quantitative data from various sources. It was especially focused on the enrollment process for qualified individuals and the reimbursement system in five local government entities (LGUs). | In almost all of the LGUs analyzed, the proportion of people enrolled as "poor" outnumbered the number of people formally classified as being poor by a factor of 1 to 11. Interviews uncovered people who were "politically indigent," i.e., enrolled as impoverished despite not being needy. Due to structural and political flaws in the reimbursement claim and payment processes, several health centers were not getting paid by PhilHealth.[47]. |
| 12. Uy, J.,( 2021)   | The Financial Health of<br>Select Philippine Hospitals<br>and the Role of the Philippine<br>Health Insurance Corporation<br>as the National Strategic<br>Purchaser of Health Services | Hospitals and other primary healthcare facilities are essential components of every health system. In order to maintain and raise the quality of their services, providers need to have both the financial stability to continue providing healthcare services without going out of business and the necessary profitability.  | In order to support both inpatient and primary healthcare providers in the nation and to protect Filipinos from financial risk, the Philippine Health Insurance Corporation (PhilHealth) is envisioned as the national purchaser of health services. [61].   |
| 13. Hindle, D. (2021)  | Health insurance in the Philippines: bold policies and socio-economic realities   | The scheme was created to offer greater and better medical services than was already possible through a combination of insurance plans that only covered a portion of the population and services that were partially subsidized by government facilities and paid for by general taxation.  | In particular, we suggest that the focus should be on more formal and explicit rationing that takes account of cost per quality-adjusted life-year; and radical adjustment of financial incentives for care providers including capitation and per case payment based on costed clinical pathways for high-volume case types. Finally, we comment briefly on lessons that might be learned by both The Philippines and Australia [29].                   |
| 14. Dror, D. (2005)  | Field based evidence of<br>enhanced healthcare<br>utilization among persons   | Micro health insurance units<br>(MIUs) are created by informal<br>sector groups because people<br>cannot access health insurance or  | A higher frequency of visits to a primary care physician, a higher rate of chronic diseases being diagnosed, higher  |

|  | insured by micro health insurance units in Philippines  | are dissatisfied with the programmes they can access. The policy choice to support MIUs relies on evidence that affiliation with these schemes increases healthcare utilization.   | hospitalization rates, higher rates of professionally attended births, lower rates of home births, and better medication compliance among the chronically ill were all reported by insured people. We conclude that MIUs can reduce the underutilization of healthcare in the Philippines.[18].   |

Sage Journals.   | An analysis of the quantitative effects of not having health insurance.   | When they are diagnosed with the disease, uninsured people tend to be in more advanced stages of the illness and receive less preventive and therapeutic care. Due to this issue, having health insurance will reduce death rates by 10% to 15% for each person in the community. [27].  |
| 34. Addington, W. W. (1999).                      | No health insurance? It's enough to make you sick—Scientific research linking the lack of health coverage to poor health                                    | The development of science, technology, and medical practice has won the admiration of people all around the world. The advancement of medicine in the United States is largely due to the efforts of eminent researchers, prestigious academic and clinical centers, and accomplished practitioners. This article discusses additional factors that might lead to the loss of benefits from not having health insurance. | As a result, patients with access to healthcare can take advantage of widely accessible medications and treatments for conditions including cancer, cardiovascular disease, and other infections, as well as cutting-edge tools and personnel when hospitalization is necessary. The emphasis on early disease identification and preventive care in American medicine is also noteworthy since it aids people with access to health care in avoiding diseases that could be prevented. [2]. |

| 37. Obermann, K., Jowett, M. R., Alcantara, M. O., Banzon, E. P., & Bodart, C. (2006). | Social health insurance in a developing country: the case of the Philippines  | The Philippines, which launched a SHI program 35 years ago, has a lot to offer other low- and middle-income countries on how to create comparable programs. The researchers look at the challenges that PhilHealth, the nation's health insurance, is currently experiencing.  | The Philippines has so far been a success story and can serve as an example for other countries in similar situations. For instance, SHI is based on value decisions, SHI is a financing institution and needs to be treated as such; SHI can be implemented independently of the current economic situation and may actually contribute to economic development; community-based health care financing schemes should be merged with the national SHI in the long run; and (v) there is a strong correlation between SHI and economic development. [41]. |
| 38. Sewell, J., McDaniel, CC., Harris, SM., Chou C. (2003).                            | Implementation of a pharmacist-led transitions of care program in an indigent care clinic: A randomized controlled trial. | The study was carried out as a single-blind, parallel, randomized controlled experiment at an indigent care clinic.  | The intervention was implemented successfully in the clinic, but patient-level barriers to follow-ups included transportation constraints, financial challenges, irregular telephone communication, and a lack of knowledge of the importance of follow-ups.[52].   |
| 39. Manasan, RG. (2016).   | Expanding social health insurance coverage: new issues and challenges.  | PhilHealth's strategic approach to increasing population coverage has been dubbed "squeezing the middle": I "squeezing from the top" by increasing coverage of the Employed Sector Program for the group subject to mandatory enrollment, (ii) "squeezing from the bottom" by increasing coverage of the poor households under the Sponsored Program, and (iii) "squeezing the middle" by implementing interventions that are intended to increase coverage of nonpoor households. | According to the analysis, increasing the number of people covered by the social health insurance program may be difficult to do without also changing other parts of the program, particularly the payment structure. [37].  |

| 40. Gella, HB., Caelian, MV. (2022)                              | Implementation of Primary Healthcare Services in Community Health Stations in Highly Urbanized City                      | The descriptive strategy was used in this study's quantitative research design. The scope of the implementation of basic healthcare services in community health stations was described using the descriptive approach. Utilizing the factors mother and child health care, the management of infectious and non-infectious diseases, and health education Pre- and postnatal examinations, products and services for family planning, increased immunization programs, nutrition programs, and integrated management of pediatric ailments are all included in maternal and child healthcare. The focus of infectious disease therapy at the time was on preventing HIV/AIDS, rabies, vector-borne infections, and tuberculosis. | According to the findings, which were supported by Abrigo et al. (2017) and del Granado et al. (2018)  A fragmented healthcare system resulted from the decentralization of healthcare services, which gave local governments the responsibility of funding and providing primary care services to their constituents.  While this is going on, Lobo et al. (2014) discovered that the government is particularly concerned about healthcare, therefore the delivery of services at the community level is excellent. [25].   |

(2021).                        | The Lived Realities of Health Financing: A Qualitative Exploration of Catastrophic Health Expenditure in the Philippines | This article is the result of a multi-sited qualitative experiment in the Philippines that used FGDs to gather information about people's long-term health objectives and the obstacles they face in achieving them. We used grounded theory approaches to examine how low- and middle-income Filipinos pay for their healthcare requirements, with a particular focus on the area of health financing.   | For many Filipinos, health finance frequently calls for the involvement of several players and involves both anticipated and unanticipated issues during the course of the sickness. [32].  |
| 42.Goldman, AL., McCormick, D., & Haas, JS., Sommers, BD. (2018) | Effects Of The ACA's Health<br>Insurance Marketplaces On<br>The Previously Uninsured: A<br>Quasi-Experimental Analysis   | Analyzed information from the Agency for Healthcare Research and Quality's (AHRQ) nationally representative Medical Expenditure Panel Survey (MEPS). Each household member's data is gathered over a two-year period, and two-year, longitudinal data sets are accessible.  | Among the 9,653 persons in our research sample, 5,770 had ongoing employer-sponsored insurance (compared to 4,047 in the pre-ACA period), whereas 3,883 were uninsured for six months or longer in year 1 (2,688 in the pre-ACA period) (exhibit 1). The uninsured (intervention group) group differed from the control group in that it was younger, more likely to be male, Hispanic, and to reside in the South or West. It also differed from the group with stable employer-sponsored insurance (the control group). The intervention group's mean family income was lower, and its members were slightly less |

|  |   |   | likely to have been employed prior to the ACA—despite the fact that both groups' adult populations were largely employed. [26].  |

| 43. Dalmacion, Godofreda V.; Juban, Noel R.; Zordilla, Zenith. (2016). | Optimizing PhilHealth's Case-based Payment Scheme to Achieve Greater Financial Protection   | The study employed qualitative techniques such as key informant interviews, desk reviews, and surveys with pretested questionnaires (KIIs). Using a frame of all accredited private and public hospitals with current PhilHealth certification, a purposeful sample was conducted in seven healthcare facilities. The 16 hospital administrators that participated in the surveys (KIIs) were surveyed. Twenty doctors who served as a representative sample of individual healthcare professionals completed a self-administered survey questionnaire.   | Aside from the local government all hospital administrators thought the CBP was superior to the FFS because, especially in the first six months of operation, it reduced the turnaround time for reimbursement to facilities from six months to two months.  [15].   |

Chakraborty, Sarbani. 2013.  | Philippines' Government<br>Sponsored Health Coverage<br>Program for Poor<br>Households.   | An in-depth evaluation of the government's implementation of the Health Coverage Program (HCP) for Poor Households in the Philippines.  | Increase access to crucial medical care for low-income families without putting their finances at risk.[14].   |
| 45. Ambong, RM., Gonzales, A., & Jr, Bais L. (2021)                    | Health-Seeking and Access Promotion among Pantawid Pamilyang Pilipino Program (4Ps) Grantees in San Jose, Occidental Mindoro, Philippines | In order to get the necessary data for this paper's case study methodology, focus groups, key informant interviews, and surveys were all conducted (FGD). The case study's main focus was the problem of poor access to healthcare services and the low participation of 4Ps household grantees in the sharing of financial risk for healthcare. Respondents for the study were chosen from a quota sample of 110 people per barangay. They belonged to the Pantawid Pamilyang Pilipino Program (4Ps) in Barangay Labangan, Pagasa, and Caminawit, which provided Conditional Cash Transfer (CCT) benefits to members of the family. With the use of the municipal contacts allocated to the designated barangays, these people were located. | The communities that were chosen received the following training as a result of the social investigation that was done. The interventions required by each barangay vary, as illustrated in table 1 below. According to the surveys and focus group discussions, however, Barangay Caminawit and Barangay Pagasa, which are both designated as coastal barangays, have comparable needs. Furthermore, it is highlighted that many households in these barangays have limited access to healthcare services and little involvement in the financial risk sharing for healthcare. [6]. |

| 46. Reynolds, H. Y. (2009)  | Free medical clinics: helping indigent patients and dealing with emerging health care needs       | In this work, a simulation laboratory approach was applied.   | A national emergency of sorts exists due to the current overpopulation of individuals in our society without dependable access to health care. The future treatment will include free clinics. To address the clinical need, it's crucial to have willing, qualified, and maybe retired volunteer care workers. [51]   |

(1991)   | Health care access problems<br>of medically indigent<br>emergency department walk-<br>in patients | Survey of stable ED walk-in patients in the triage area.  | Regular use of the ED for care (P .003), income of less than \$10,000 (P .0002), rejection of care by a healthcare provider (P .001), refusal of care in an ED (P .03), and delay in seeking healthcare (P .0002) were all strongly correlated with public aid/self-pay insurance status. Regular use of the ED for care (P .02) and delaying seeking care (P  |

|  | .04) were both strongly correlated with income of less than \$10,000. Binomial test and 2 with continuity correction were used in the statistical analysis to |
|--|---|
|  | compare two proportions. [44]   |

#### CONCLUSION

The medical world constantly continues to evolve and different health crises arise. In a developing country healthcare insurance is a vital matter. In the Philippines medical care indemnity regularly went through amendment. Based on the data stated in the results and discussion of this review article, regardless of the benefits of medical insurance, another matter contributes to making them not securely covered with health insurance, especially to the people living in rural areas in the Philippines, geographic remoteness of the place making healthcare service difficult to achieve as this still needs their personal finances for the expenses which are not covered by the medical care indemnity. Another factor that affects the wide and deep coverage of medical insurance in the Philippines is the lack of revenues, making the community utilise out-of-pocket money, with that being matter it proffers financial problems to the indigent sectors. Some Filipino citizens in this socioeconomic area are not knowledgeable and do not understand enough about the big role medical insurance plays. This causes a holdback as this will not induce them to become part of a medical insurance program. Despite the aim of providing universal health care to different sectors, the country's still lacking its services, especially for the indigent community. As there are other matters that contribute to covering financial problems in terms of medical care.
