## ABSTRACT:

This paper is devoted to obtain non-zero distinct integer solutions to non-homogeneous cubic equation with four unknowns given by $x y+2 z^{2}=10 w^{3}$.
Keywords: Non-homogeneous cubic, Cubic with four unknowns, Integer solutions.

## Introduction:

Diophantine equations theory have been working by numerous mathematicians since ancient time of Diophantus. There is a big gap in the general theory of homogeneous/non homogeneous cubic equations with three or more variables. Also, the cubic diophantine equations are rich in variety and offer an unlimited field for research [1, 2]. For an extensive review of various problems, one may refer [3-30]. This paper concerns with another interesting nonhomogeneous cubic diophantine equation with four unknowns $x y+2 z^{2}=10 w^{3}$ for determining its infinitely many non-zero integral solutions.

## Method of Analysis:

The non-homogeneous cubic equation with four unknowns to be solved is

$$
\begin{equation*}
x y+2 z^{2}=10 w^{3} \tag{1}
\end{equation*}
$$

The process of obtaining different sets of non-zero distinct integer solutions to (1) is
illustrated below:
Illustration 1:
The introduction of the linear transformations

$$
\begin{equation*}
\mathrm{x}=2 \mathrm{p}, \mathrm{y}=2 \mathrm{q}, \mathrm{z}=\mathrm{p}-\mathrm{q},(\mathrm{p} \neq \mathrm{q}) \tag{2}
\end{equation*}
$$

in (1) leads to

$$
\begin{equation*}
\mathrm{p}^{2}+\mathrm{q}^{2}=5 \mathrm{w}^{3} \tag{3}
\end{equation*}
$$

Assume

$$
\begin{equation*}
\mathrm{w}=\mathrm{a}^{2}+\mathrm{b}^{2} \tag{4}
\end{equation*}
$$

Express the integer 5 on the R.H.S. of (3) as the product of complex conjugates as

$$
\begin{equation*}
5=(2+i)(2-i) \tag{5}
\end{equation*}
$$

Using (4) and (5) in (3) and employing the method of factorization, define

$$
\begin{equation*}
\mathrm{p}+\mathrm{iq}=(2+\mathrm{i})(\mathrm{a}+\mathrm{i} \mathrm{~b})^{3} \tag{6}
\end{equation*}
$$

On equating the real and imaginary parts in (6) ,it is seen that

$$
\begin{equation*}
\mathrm{p}=2 \mathrm{f}(\mathrm{a}, \mathrm{~b})-\mathrm{g}(\mathrm{a}, \mathrm{~b}), \mathrm{q}=\mathrm{f}(\mathrm{a}, \mathrm{~b})+2 \mathrm{~g}(\mathrm{a}, \mathrm{~b}) \tag{7}
\end{equation*}
$$

where

$$
\begin{equation*}
f(a, b)=a^{3}-3 a b^{2}, g(a, b)=3 a^{2} b-b^{3} \tag{8}
\end{equation*}
$$

In view of (2) ,the integer solutions to (1) are given by
$x=4 f(a, b)-2 g(a, b), y=2 f(a, b)+4 g(a, b), z=f(a, b)-3 g(a, b)$
along with (4).

Note 1:

Apart from (5) ,the integer 5 on the R.H.S. of (3) is expressed as below:

$$
\begin{aligned}
& 5=(1+2 \mathrm{i})(1-2 \mathrm{i}), \\
& 5=\frac{(2+11 \mathrm{i})(2-11 \mathrm{i})}{25}, \\
& 5=\frac{(2+29 \mathrm{i})(2-29 \mathrm{i})}{169}
\end{aligned}
$$

The repetition of the above process leads to three more sets of integer solutions to (1).

Illustration 2:

Introducing the linear transformations

$$
\begin{equation*}
\mathrm{x}=\mathrm{u}+\mathrm{z}, \mathrm{y}=\mathrm{u}-\mathrm{z} \tag{9}
\end{equation*}
$$

in (1) gives

$$
\begin{equation*}
u^{2}+z^{2}=10 w^{3} \tag{10}
\end{equation*}
$$

which is satisfied by

$$
\begin{gather*}
\mathrm{u}=10^{2} \mathrm{~m}\left(\mathrm{~m}^{2}+\mathrm{n}^{2}\right)  \tag{11}\\
\mathrm{z}=10^{2} \mathrm{n}\left(\mathrm{~m}^{2}+\mathrm{n}^{2}\right), \mathrm{w}=10\left(\mathrm{~m}^{2}+\mathrm{n}^{2}\right) \tag{12}
\end{gather*}
$$

In view of (9), it is seen that

$$
\begin{equation*}
\mathrm{x}=10^{2}(\mathrm{~m}+\mathrm{n})\left(\mathrm{m}^{2}+\mathrm{n}^{2}\right), \mathrm{y}=10^{2}(\mathrm{~m}-\mathrm{n})\left(\mathrm{m}^{2}+\mathrm{n}^{2}\right) \tag{13}
\end{equation*}
$$

Thus , (12) and (13) give the integer solutions to (1).
Illustration 3:

Express the integer 10 on the R.H.S. of (10) as the product of complex conjugates as

$$
\begin{equation*}
10=(3+i)(3-i) \tag{14}
\end{equation*}
$$

Using (4) \& (14) in (10) and following the procedure as in Illustration 1 ,the integer
solutions to (1) are found to be

$$
\begin{equation*}
\mathrm{x}=4 \mathrm{f}(\mathrm{a}, \mathrm{~b})+2 \mathrm{~g}(\mathrm{a}, \mathrm{~b}), \mathrm{y}=2 \mathrm{f}(\mathrm{a}, \mathrm{~b})-4 \mathrm{~g}(\mathrm{a}, \mathrm{~b}), \mathrm{z}=\mathrm{f}(\mathrm{a}, \mathrm{~b})+3 \mathrm{~g}(\mathrm{a}, \mathrm{~b}) \tag{15}
\end{equation*}
$$

Thus, (4) and (15) represent the integer solutions to (1).
Note 2:
It is to be noted that the integer 10 on the R.H.S. of (10) is also considered as

$$
10=(1+3 \mathrm{i})(1-3 \mathrm{i})
$$

This choice leads to a different set of integer solutions to (1).
Illustration 4:
Introducing the transformations

$$
\begin{equation*}
\mathrm{x}=2 \mathrm{p}, \mathrm{y}=2 \mathrm{w}, \mathrm{z}=\mathrm{p}-\mathrm{w}, \mathrm{p} \neq \mathrm{w} \tag{16}
\end{equation*}
$$

in (1) , it is written as

$$
\begin{equation*}
\mathrm{p}^{2}=\mathrm{w}^{2}(5 \mathrm{w}-1) \tag{17}
\end{equation*}
$$

There are two sets of integer solutions to (17) as shown below:
$\mathrm{w}=\left(\begin{array}{c}5 \mathrm{k}^{2}-6 \mathrm{k}+2, \\ 5 \mathrm{k}^{2}-4 \mathrm{k}+1\end{array}\right.$
$\mathrm{p}=\left(\begin{array}{l}\left(5 \mathrm{k}^{2}-6 \mathrm{k}+2\right)(5 \mathrm{k}-3), \\ \left(5 \mathrm{k}^{2}-4 \mathrm{k}+1\right)(5 \mathrm{k}-2)\end{array}\right.$,

In view of (16), the corresponding two sets of values of $X, Y, Z$ satisfying (1) are
respectively given by
$\mathrm{x}=2(5 \mathrm{k}-3)\left(5 \mathrm{k}^{2}-6 \mathrm{k}+2\right), \mathrm{y}=2\left(5 \mathrm{k}^{2}-6 \mathrm{k}+2\right), \mathrm{z}=(5 \mathrm{k}-4)\left(5 \mathrm{k}^{2}-6 \mathrm{k}+2\right)$
$\mathrm{x}=2(5 \mathrm{k}-2)\left(5 \mathrm{k}^{2}-4 \mathrm{k}+1\right), \mathrm{y}=2\left(5 \mathrm{k}^{2}-4 \mathrm{k}+1\right), \mathrm{z}=(5 \mathrm{k}-3)\left(5 \mathrm{k}^{2}-4 \mathrm{k}+1\right)$
It is worth to mention that, apart from the above integer solutions, there are other choices of integer solutions to (1) which are exhibited below in Table 1:

Table 1 - Integer solutions

| S. No | $x$ | $y$ | $z$ | $w$ |
| :--- | :--- | :--- | :--- | :--- |
| 1 | $2 a^{3 s}$ | $4 a^{3 s}$ | $a^{3 s}$ | $a^{2 s}$ |
| 2 | $2 a^{6 s}$ | 4 | $a^{3 s}$ | $a^{2 s}$ |
| 3 | $4 a^{6 s}$ | 2 | $a^{3 s}$ | $a^{2 s}$ |

| 4 | $5000 \mathrm{a}^{6 \mathrm{~s}}$ | 1 | $50 \mathrm{a}^{3 \mathrm{~s}}$ | $10 \mathrm{a}^{2 \mathrm{~s}}$ |
| :--- | :--- | :--- | :--- | :--- |
| 5 | $10\left(5 \mathrm{a}^{2}+1\right)^{2}$ | 1 | $5 \mathrm{a}\left(5 \mathrm{a}^{2}+1\right)$ | $\left(5 \mathrm{a}^{2}+1\right)$ |
| 6 | $5\left(5 \mathrm{a}^{2}+1\right)^{2}$ | 2 | $5 \mathrm{a}\left(5 \mathrm{a}^{2}+1\right)$ | $\left(5 \mathrm{a}^{2}+1\right)$ |
| 7 | $2\left(5 \mathrm{a}^{2}+1\right)^{2}$ | 5 | $5 \mathrm{a}\left(5 \mathrm{a}^{2}+1\right)$ | $\left(5 \mathrm{a}^{2}+1\right)$ |
| 8 | $5\left(5 \mathrm{a}^{2}+1\right)$ | $2\left(5 \mathrm{a}^{2}+1\right)$ | $5 \mathrm{a}\left(5 \mathrm{a}^{2}+1\right)$ | $\left(5 \mathrm{a}^{2}+1\right)$ |
| 9 | $2 \mathrm{k}^{3} \mathrm{~s}^{2}$ | $5 \mathrm{~s}-\mathrm{ks}^{2}$ | $\mathrm{k}^{2} \mathrm{~s}^{2}$ | ks |
| 10 | $10 \mathrm{k}^{3} \mathrm{~s}^{2}$ | $\mathrm{~s}-5 \mathrm{ks}^{2}$ | $5 \mathrm{k}^{3} \mathrm{~s}^{2}$ | ks |
| 11 | $10 \mathrm{k}^{2} \mathrm{~s}$ | $\mathrm{ks} 2-5 \mathrm{~s}$ | $5 \mathrm{ks}^{2}$ | ks |

## Conclusion:

In this paper, we have made an attempt to determine different patterns of non-zero distinct integer solutions to the non-homogeneous cubic equation with four unknowns given by $x y+2 z^{2}=10 w^{3}$ As the cubic equations are rich in variety, one may search for other forms of cubic equations with multi-variables to obtain their corresponding solutions.
